SUMMARY

AI and full-stack engineer, 4+ years building production systems. I build AI agent infrastructure and LLM pipelines at Codygo, and own the full backend at an art marketplace. Strongest on the hard parts: AWS, distributed systems, event-driven architecture. The layer where AI products hold up under load or don't.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Python, HTML/CSS, SQL
Frameworks: Node.js, Express.js, NestJS, Next.js, React, Tailwind CSS, Chakra UI
AI & Agents: MCP (Model Context Protocol), Mastra, LLM pipeline integration
Cloud: AWS (CDK, Lambda, Batch, Fargate, EventBridge, Cognito, DynamoDB, CloudFront, S3)
Databases: MongoDB, PostgreSQL, Redis, MySQL, Supabase, BigQuery
Infra & DevOps: Docker, GitHub Actions, Playwright
Payments: Paystack (webhooks, subscriptions, split payments)
Tools: Bull, Zod, React Hook Form, Git

EXPERIENCE

Codygo

AI / Full-Stack Engineer

Remote

Oct. 2025 – Present

- Built multi-tenant auth for 12 enterprise tenants using Cognito pre-token triggers, injecting RBAC claims without per-tenant user pools.
- Encrypted enterprise credentials end-to-end with KMS envelope encryption, Secrets Manager, and Slack-driven human approval.
- Scheduled LLM batch jobs off-peak via EventBridge and Lambda, fanning out 3 pipelines concurrently to cut inference cost ~25%.
- Fixed non-deterministic agent failures by building a DOM automation framework with quiescence gating and element identity tracking. [Case study](#)
- Sequenced deploys across 6 interdependent MongoDB collections with graph traversal, making environment promotions repeatable and manual-free.
- Provisioned a 7-service AWS CDK stack powering a sync platform with 49 third-party integrations; right-sized Lambda and CloudFront to cut cold starts. [Case study](#)

Vascan Arts (vascan.io)

Full-Stack Developer

Remote

Apr. 2022 – Present

- Killed thundering-herd failures on an API at 500 peak requests, cutting redundant DB hits ~65% with layered caching and request dedup. [Case study](#)
- Built an async payment pipeline across 10 Paystack webhook types using Bull queues, with DB-level dedup that ended duplicate settlements.
- Rate-limited outreach workflows with IP throttling and feature flags, keeping enforcement latency flat via compound-indexed queries.
- Routed multi-vendor carts through a settlement engine that splits items, deducts fees, and pays each merchant independently. [Case study](#)

PROJECTS

Debt Tracker – Group Lending App (Backend) | [GitHub](#) | [Case study](#) | NestJS, Prisma, PostgreSQL

2025

- Architected and shipped the complete backend for a React Native group debt-tracking app: 43 REST endpoints across 12 NestJS modules (auth, groups, RBAC membership, loans, transactions, invitations, notifications) on Render against Neon serverless Postgres. Core feature: a loan-splitting engine that fans a shared debt into per-member child loans via a self-referential parent/child model, created atomically in a single Prisma transaction to eliminate partial-split states.
- Built a dual-channel notification system (Expo push + Handlebars/Postmark email) with per-user channel preferences and a fan-out join table driving 11 distinct event types, each with independent read-state tracking per recipient. Automated due-date reminders and overdue alerts via cron jobs; secured the client with Supabase-backed JWT auth (Passport), request-level validation, and a global exception filter.

Serverless YouTube File Sync | [GitHub](#) | AWS CDK, Lambda, Docker (arm64), SQS, DynamoDB, S3, yt-dlp

Oct. 2025

- Serverless, event-driven video sync pipeline on AWS (CDK, Lambda, SQS, DynamoDB) – automates search, download, and S3 storage end-to-end. Custom arm64 Docker image (Graviton) bundles yt-dlp and ffmpeg; S3-cached cookie management and multi-client fallback handle YouTube rate limits reliably.

EDUCATION

University of Lagos, Lagos, Nigeria

B.Sc. Statistics

2023
